

infection

IN-1

The Audible Disease Infection IN-1 is a deranged dual oscillator digital noise synthesizer that is controlled by a tiny finger operated joystick. Each of the two oscillators produces a fizzy saw tooth wave. The X-axis of the joystick controls the frequency of the first oscillator and the Y-axis controls the frequency of the other. This demented device can generate sounds all the way from relentless screeching highs down to severe rumbling lows. Extreme cacophony ensues when the two oscillators are slightly out of phase with each other. The intensity knob controls the vigor and color of the final sound. Plug in the Infection and give birth to audio torment.

Operates with a standard 9-volt adapter (not included). May we recommend the Visual Sound 1SPOT power adapter? The Infection has a single 1/4" mono output.
